

One key goal of the design is aimed at allowing visitors to not only see the ocean, but to experience it and the awesome power it generates. It has such a profound impact on us through weather systems, but also through imagination and the curiosity it inspires in us. The pier turns this curiosity we have with the ocean into a playful space, and this design furthers that through the winding overhead planes and wavy paths.

A range of experiences are created on the winding path that allows visitors to interact with the Wave Power Energy Source. Visitors experience a restored kelp forest between the breakwater and the pier, meant to minimize the environmental impact and create a habitat for the diverse ecological systems that this area of California is known for.
