

CATCH A WAVE
CONCEPT

One of the strongest connections between the ocean and the human being that can be accomplished is surfing. This is a rare moment where we can directly feel the power of ocean and translate it into force which enables movement of the surfer on the board. Santa Monica's surfers are one of the first associations and inspirations with the strength of wind and ocean. The location next to the pier, on the water is a ideal in order to shape installation that encompasses surfers as people of Santa Monica and nature as wind and water.

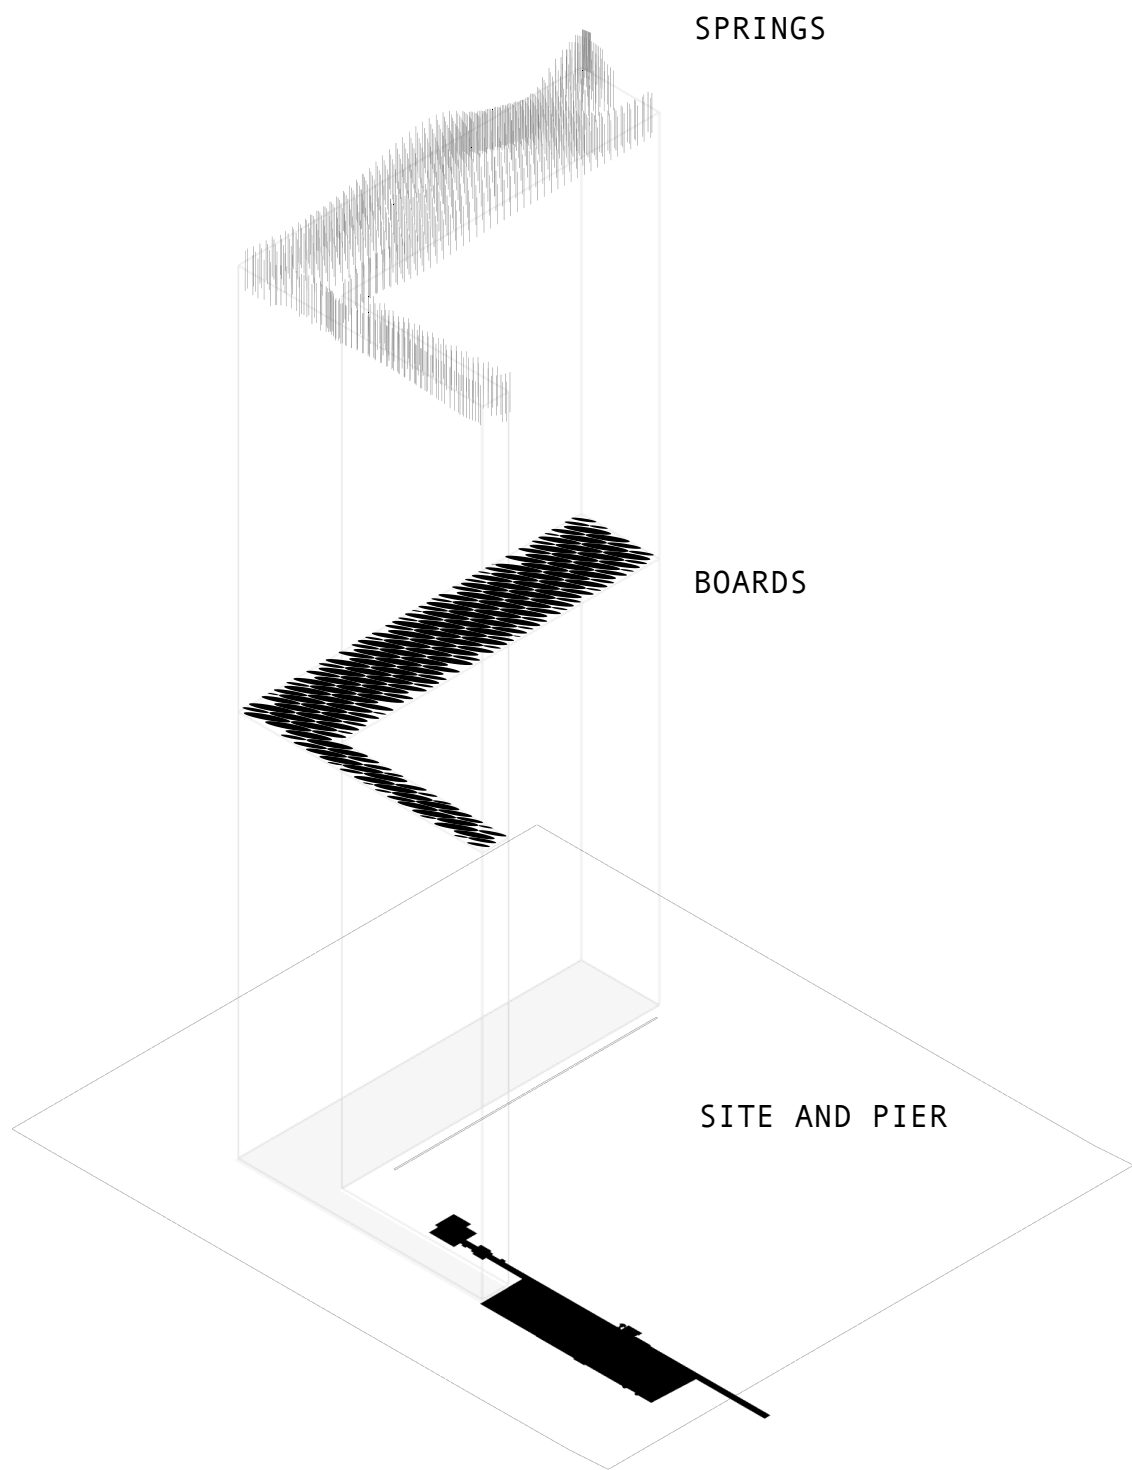

The main linking point between ocean and person is the surfboard which makes the whole process possible, because of its form, material and permanence to water. An architectural concept is based on the smoothness of the boards that can integrate and become a part of the water and carry stalks which catches the wind. The boards are capturing the energy of the water and the

stalks the energy of the wind. The installation captures each moment of the water and wind movement and presents it to its visitors.
