Our artwork evokes a vegetative formation, so we focus our interest on the Water Hyacinth, not only for their appearance, but also for their phytoremediation process regarding to water. We design the following two relative devices, although each has their own function and appearance:

Water Hyacinth A:  
Its main function is to generate green energy through two systems associated with the sea waves and the sunlight. The first system is submerged and anchored to the seabed; meanwhile the second one emerges from the sea and responds to the solar movement and sunlight.

Water Hyacinth A. Isometric
