

“Light Drop” is a light-oriented artwork with different possible meanings. It is a project of reflected and projected light, with its reflective surface constantly changing in respect to the different light conditions of the surrounding environment.

During the sunset the "Drop" becomes a "PV Sun". The PV panels provide electricity to the desalination plant.

The "Drop" houses a public panoramic space, a dome-shaped observatory with a 360-degrees view.

During the day the "Light Drop" resembles a drop of water suspended over the skyline.

During the night the "Light Drop" becomes a sort of lighthouse with a computer-controlled display.
