

THE FLIP SIDE

The motivation of the installation is to inspire people to recall the renewable source of energy and water through not only the distinguishing shape of the beautiful structure but also the sustainable methods to generate electricity and drinking water. Also, by creating the green space floating on the sea, the work tried to provide people visiting the Santa Monica beach the place to rest in vitality originated from the ocean.

The twisted form of the artifact emphasizes the fact that the fresh water is the flip side of seawater sharing identical innate characteristics by showing the reverse side of the plate. The lower part of the structure symbolizing the ocean, the lawn area on the upper part representing the land, and the desalination process over the structure imitating the water cycle, all of them is a microcosm of the earth where the water circulates.

The buoyant objects, the electric generator, swaying in the seawater highlight waves' movement, the eco-friendly energy source.
